

# Object Methods

## 1 Object.keys(obj)

Returns all keys → **array of property names**.

```
const user = { name: "Prajwal", age: 22 };
```

```
Object.keys(user);
```

Output:

```
["name", "age"]
```

## 2 Object.values(obj)

Returns all values.

```
Object.values(user);
```

Output:

```
["Prajwal", 22]
```

## 3 Object.entries(obj) 🔥 Most Powerful

Returns key-value pairs as nested arrays.

```
Object.entries(user);
```

Output:

```
[  
  ["name", "Prajwal"],  
  ["age", 22]  
]
```

## 5 Object.assign() (Clone / Merge)

```
const a = { x: 1 };
```

```
const b = { y: 2 };
```

```
const merged = Object.assign({}, a, b);
```

Output:

```
{ x: 1, y: 2 }
```

#### **8** **Object.freeze(obj)** ❄️ **(Full Lock)**

```
const config = { port: 3000 };
```

```
Object.freeze(config);
```

```
config.port = 5000; // ignored
```

#### **4** **Interview Question**

Difference between:

```
const a = obj;
```

```
const b = {...obj};
```

First copies reference.

Second clones data.
